

## Newmont Reports 2017 Reserves and Resources; Reserve additions replace depletion, Resources increase

DENVER, February 21, 2018 – Newmont Mining Corporation (NYSE: NEM) (Newmont or the Company) reported gold reserves of 68.5 million attributable ounces for 2017, unchanged from 2016 as additions and revisions fully replaced depletion at a constant gold price, and increased gold resources<sup>1</sup> to 48.2 million ounces.

The Company added 6.4 million ounces of gold reserves, 4.4 million ounces through exploration and projects and 2.0 million ounces through revisions and acquisitions. Newmont reported 5.3 million ounces of attributable mine production in 2017 resulting in 6.4 million contained ounces of reserve depletion.

Notable additions and revisions for the year include 1.8 million ounces at Boddington, 0.8 million ounces each at Carlin Underground and Cripple Creek & Victor, 0.7 million equity ounces at Turquoise Ridge, 0.6 million ounces at Ahafo Open Pits and 0.4 million ounces at Tanami. These improvements demonstrate a strengthened reserve base across the portfolio.

Gold reserve grades decreased five percent to 1.14 grams per tonne compared to 1.20 grams per tonne in the prior year, largely due to the conversion of lower grade ounces at Boddington and Cripple Creek & Victor.

Gold resources increased to 48.2 million ounces, up one percent from the prior year and offsetting the conversion of resource ounces to reserves. The Company added 6.9 million ounces of gold resource through exploration and studies at a constant gold price and 0.7 million ounces through acquisitions which more than offset the conversion of 7.2 million ounces to reserves.

Notable resource additions include first-time declarations at Akyem Underground of 1.3 million ounces and Sabajo (Merian) of 0.6 million equity ounces, 0.9 million ounces at Tanami, 0.7 million ounces at Turquoise Ridge and further additions of 0.5 million ounces each at Yanacocha, Boddington, Carlin Open Pit, Carlin Underground and Ahafo Underground.

Resource grades improved seven percent to 0.92 grams per tonne compared to 0.86 grams per tonne in the prior year, largely due to higher grade underground additions at Akyem, Carlin, Ahafo and Turquoise Ridge, and the conversion of lower grade resource ounces to reserves at Boddington and Cripple Creek & Victor.

2017 attributable gold Reserves (Moz)

2017 attributable gold Resources<sup>2</sup> (Moz)

<sup>1</sup> Resources include measured, indicated and inferred resources; see cautionary statement on pages 9-10 regarding reserves and resources.

The Company reported attributable Measured and Indicated<sup>2</sup> gold resources of 34.3 million ounces, up two percent from the prior year, and 14.0 million ounces of attributable Inferred gold resources, unchanged from the prior year.

## Copper

The Company increased copper reserves by seven percent to 1.2 million tonnes and copper resources<sup>1</sup> were largely unchanged at 2.3 million tonnes.

## Exploration Outlook

Newmont's total attributable exploration expenditure<sup>3</sup> is expected to increase to approximately \$230 million in 2018 with about 70 percent allocated to just-in-time delivery of the highest margin reserves and resources and the remaining 30 percent allocated to greenfields, brownfields and innovation programs. Geographically, the Company expects to spend about 39 percent of this amount in North America, 20 percent in Australia and the remainder in South America, Africa and other locations.

## Gold Reserve Sensitivity

A \$100 increase in gold price would result in an approximate seven percent increase in gold reserves while a \$100 decrease in gold price would result in an approximate eight percent decrease in gold reserves. These sensitivities assume an oil price of \$55 per barrel (WTI) and an Australian dollar exchange rate of \$0.75.

For additional details on Newmont's reported Gold, Copper and Silver Mineral Reserves and Resources, please refer to the tables at the end of this release.

## Key Assumptions:

	Years Ended December 31,	
	2017	2016
Gold Reserves (US\$/oz)	\$1,200	\$1,200
Gold Resources (US\$/oz)	\$1,400	\$1,400
Copper Reserves (US\$/lb)	\$2.50	\$2.50
Copper Resources (US\$/lb)	\$3.25	\$3.00
Australian Dollar (A\$:US\$)	\$0.75	\$0.75
West Texas Intermediate (US\$/bbl)	\$55	\$55

<sup>2</sup> Totals may not sum due to rounding; see Attributable Gold Mineral Resources tables on Pages 5-6

<sup>3</sup> Includes capitalized and expensed exploration

## Reserve and Resource Tables

Proven and Probable reserves are based on extensive drilling, sampling, mine modeling and metallurgical testing from which we determine economic feasibility. Metal price assumptions follow SEC guidance not to exceed a three year trailing average. The price sensitivity of reserves depends upon several factors including grade, metallurgical recovery, operating cost, waste-to-ore ratio and ore type. Metallurgical recovery rates vary depending on the metallurgical properties of each deposit and the production process used. The reserve tables included in this release list the average metallurgical recovery rate for each deposit, which takes into account the assumed processing methods. The cut-off grade, or lowest grade of material considered economic to process, varies with material type, price, metallurgical recoveries, operating costs and co- or by-product credits. The Proven and Probable reserve figures presented herein are estimates based on information available at the time of calculation. No assurance can be given that the indicated levels of recovery of gold and copper will be realized. Ounces of gold and silver or pounds of copper included in the proven and probable reserves are those contained prior to losses during metallurgical treatment. Reserve estimates may require revision based on actual production. Market fluctuations in the price of gold or copper, as well as increased production costs or reduced metallurgical recovery rates, could render certain proven and probable reserves containing relatively lower grades of mineralization uneconomic to exploit and might result in a reduction of reserves.

The Measured, Indicated, and Inferred resource figures presented herein are estimates based on information available at the time of calculation and are exclusive of reserves. A "Mineral Resource" is a concentration or occurrence of solid material of economic interest in or on the Earth's crust in such form, grade, or quality and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade or quality, continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories. Ounces of gold and silver or pounds of copper included in the Measured, Indicated and Inferred resources are those contained prior to losses during metallurgical treatment. Market fluctuations in the price of gold and copper, as well as increased production costs or reduced metallurgical recovery rates, could change future estimates of resources. Please refer to the reserves and resources cautionary statement at the end of the release.

We publish reserves and resources annually, and will recalculate reserves and resources at year-end 2018, taking into account metal prices, changes, if any, in future production and capital costs, mine designs, model changes, divestments and depletion as well as any acquisitions and additions during 2018.

(1) See cautionary statement regarding reserves and resources on page 10 hereof. 2017 and 2016 reserves were calculated at a gold price of \$1,200, or A\$1,600 per ounce unless otherwise noted.

(2) Tonnes include allowances for losses resulting from mining methods. Tonnes are rounded to the nearest 100,000.

(3) Ounces are estimates of metal contained in ore tonnes and do not include allowances for processing losses. Metallurgical recovery rates represent the estimated amount of metal to be recovered through metallurgical extraction processes. Ounces may not recalculate as they are rounded to the nearest 10,000.

(4) Cut-off grades utilized in 2017 reserves were as follows: oxide leach material not less than 0.006 ounce per ton; oxide mill material not less than 0.015 ounce per ton; flotation material not less than 0.016 ounce per ton; and refractory mill material not less than 0.080 ounce per ton.

(5) Stockpiles are comprised primarily of material that has been set aside to allow processing of higher grade material in the mills. Stockpiles increase or decrease depending on current mine plans. Stockpile reserves are reported separately where ounces exceed 100,000 and are greater than 5% of the total site-reported reserves.

(6) Cut-off grade utilized in 2017 reserves not less than 0.042 ounce per ton.

(7) Gold cut-off grade varies with level of copper and silver credits.

(8) Reserve estimates provided by Barrick as of February 5 2018, the operator of the Turquoise Ridge joint venture.

(9) Cut-off grades utilized in 2017 reserves were as follows: oxide leach material not less than 0.007 ounce per ton; oxide mill material not less than 0.019 ounce per ton; and refractory mill material not less than 0.038 ounce per ton.

(10) Cut-off grade utilized in 2017 reserves not less than 0.007 ounce per ton.

(11) Cut-off grades utilized in 2017 reserves were as follows: oxide mill material not less than 0.040 ounce per ton and leach material not less than 0.005 ounce per ton.

(12) Leach pad material is the material on leach pads at the end of the year from which gold remains to be recovered. In-process reserves are reported separately where ounces exceed 100,000 and are greater than 5% of the total site-reported reserves.

(13) Gold cut-off grades utilized in 2017 reserves were as follows: oxide leach material not less than 0.004 ounce per ton; and oxide mill material not less than 0.011 ounce per ton.

(14) Cut-off grades utilized in 2017 reserves not less than 0.011 ounce per ton.

(15) Gold cut-off grade varies with level of copper credits.

(16) Cut-off grade utilized in 2017 reserves not less than 0.058 ounce per ton.

(17) Cut-off grade utilized in 2017 insitu reserves not less than 0.026 ounce per ton.

(18) Cut-off grade utilized in 2017 reserves not less than 0.016 ounce per ton.

(19) Cut-off grade utilized in 2017 reserves not less than 0.076 ounce per ton.

(20) Includes undeveloped reserves at six pits in the Ahafo trend totaling 3.4 million ounces. Cut-off grade utilized in 2017 reserves not less than 0.014 ounce per ton.

(21) Cut-off grade utilized in 2017 reserves not less than 0.017 ounce per ton.

(22) 2016 Yanacocha ownership was 51.35%

- (1) Resources are reported exclusive of reserves. Measured and Indicated Resources (combined) are equivalent to Mineralized Material disclosed in Newmont's Form 10-K filing.
- (2) Resources are calculated at a copper price of \$3.25 or A\$4.00 per pound for 2017 and at a copper price of \$3.00 or A\$3.75 per pound for 2016 unless otherwise noted. Tonnage amounts have been rounded to the nearest 100,000. Pounds may not recalculate as they have been rounded to the nearest 10 million.

(1) Resources are reported exclusive of reserves. Measured and Indicated Resources (combined) are equivalent to Mineralized Material disclosed in Newmont's Form 10-K filing.

(2) Resource for 2017 and 2016 was calculated at a silver price of \$20 per ounce. Tonnage amounts have been rounded to the nearest 100,000.

### **Cautionary Statement regarding Reserves and Resources:**

The “reserves” disclosed in this release have been prepared in compliance with Industry Guide 7 published by the SEC. As used in this news release, the term “reserve” means that part of a mineral deposit that can be economically and legally extracted or produced at the time of the reserve determination. The term “economically,” as used in this definition, means that profitable extraction or production has been established or analytically demonstrated in a feasibility study to be viable and justifiable under reasonable investment and market assumptions. The term “legally,” as used in this definition, does not imply that all permits needed for mining and processing have been obtained or that other legal issues have been completely resolved. However, for a reserve to exist, Newmont must have a justifiable expectation, based on applicable laws and regulations, that issuance of permits or resolution of legal issues necessary for mining and processing at a particular deposit will be accomplished in the ordinary course and in a timeframe consistent with Newmont’s current mine plans. Reserves in this news release are aggregated from the proven and probable classes.

The term “proven reserves” used in the tables of this news release means reserves for which (a) quantity is computed from dimensions revealed in outcrops, trenches, workings or drill holes; (b) grade and/or quality are computed from the results of detailed sampling; and (c) the sites for inspection, sampling and measurements are spaced so closely and the geologic character is sufficiently defined that size, shape, depth and mineral content of reserves are well established. The term “probable reserves” means reserves for which quantity and grade are computed from information similar to that used for proven reserves, but the sites for sampling are farther apart or are otherwise less closely spaced. The degree of assurance, although lower than that for proven reserves, is high enough to assume continuity between points of observation. Newmont classifies all reserves as Probable on its development projects until a year of production has confirmed all assumptions made in the reserve estimates. Proven and probable reserves include gold, copper or silver attributable to Newmont’s ownership or economic interest. Proven and probable reserves were calculated using cut-off grades. The term “cut-off grade” means the lowest grade of mineralized material considered economic to process. Cut-off grades vary between deposits depending upon prevailing economic conditions, mineability of the deposit, by-products, amenability of the ore to gold, copper or silver extraction and type of milling or leaching facilities available.

### **Notice for U.S. Investors:**

The terms “resources” and “Measured, Indicated and Inferred resources” are used in this news release. Investors are advised that the SEC does not recognize these terms and resources have not been prepared in accordance with Industry Guide 7. Newmont has determined that such “resources” would be substantively the same as those prepared using the Guidelines established by the Society of Mining, Metallurgy and Exploration (SME) and defined as “Mineral Resource”. Estimates of resources are subject to further exploration and development, are subject to additional risks, and no assurance can be given that they will eventually convert to future reserves. Inferred Resources, in particular, have a great amount of uncertainty as to their existence and their economic and legal feasibility. Investors are cautioned not to assume that any part or all of the Inferred Resource exists, or is economically or legally mineable. Also, disclosure of contained ounces is permitted under the SME Guideline and other regulatory guidelines, such as Canada’s NI 43-101 and Australia’s JORC. However, the SEC generally requires mineral resource information in SEC-filed documents to be reported only as in-place tonnage and grade. Investors are reminded that even if significant mineralization is discovered and converted to reserves, during the time necessary to ultimately move such mineralization to production the economic feasibility of production may change. See the Company’s Annual Report for the “Proven and Probable Reserve” and “Mineralized Material” tables prepared in compliance with the SEC’s Industry Guide 7, available at [www.newmont.com](http://www.newmont.com) and on [www.sec.gov](http://www.sec.gov). Investors are reminded that the tables presented in the Annual Report are estimates as of December 31, 2017 and were presented on an attributable basis reflecting the Company’s ownership interest at such time.

### **Cautionary Statement Regarding Forward Looking Statements:**

This release contains “forward-looking statements” within the meaning of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended, which are intended to be covered by the safe harbor created by such sections and other applicable laws. Such forward-looking statements may include, without limitation, estimates and expectations of future exploration expenditures and activities. Where the Company expresses or implies an expectation or belief as to future events or results, such expectation or belief is expressed in good faith and believed to have a reasonable basis. However, such statements are subject to risks, uncertainties and other factors, which

could cause actual results to differ materially from future results expressed or implied by the “forward-looking statements”. For a discussion of such risks relating to our business and other factors, see the Company’s Form 10-K, filed on February 22, 2018, with the Securities and Exchange Commission under the headings “Risk Factors” and “Forward-Looking Statements.” The Company does not undertake any obligation to release publicly revisions to any “forward-looking statement,” including, without limitation, outlook, to reflect events or circumstances after the date of this news release, or to reflect the occurrence of unanticipated events, except as may be required under applicable securities laws. Investors should not assume that any lack of update to a previously issued “forward-looking statement” constitutes a reaffirmation of that statement. Continued reliance on “forward-looking statements” is at investors' own risk.
